ABC Inc. ‖ RootBeer Project

https://github.com/aiharc1/cs472-group4

Overview

RootBeer checks to see if a device has root. It performs various checks including checking java files like root management apps, potentially dangerous apps and much more. RootBeer is designed to be an app and currently has a sample available.

Work Completed

The team collaborated well together with the highest contributions from scottyab and stealthcopter with around 50 commits each. Friederbluemle, altvnv, and danielkutik had a few commits, and everyone else had minimal contributions. Most work was done in the beginning (June 14, 2015) of this project and the rest were spread through mid-2021. I have attached a diagram of the contributions from our authors in respect to the project's inception date.

Helpful Commands

- *git clone* – to clone public repositories
- *git pull /git push* – to pull/push to github main repositories
- *git branch* – to create a new branch on local repositories
- *git checkout* – to switch to other branches
- *git commit* – used to publish changes to the main repository
